New Tooling Design Provides Increased Production Capacity

Mereen-Johnson announces the completion of comprehensive testing of a new tooling design providing capability of producing glue joint accuracy at speed feed rates of up to 200' per minute on its line of straight line multiple rip saws.

Mereen-Johnson Machine Company pioneered the concept of edge gluing directly from the saw blade edge of the gang rip saw. Standard tooling offered maximum glue line production speeds of approximately 125' per minute.

This new tooling development can dramatically increase productivity with a minimal investment.

Existing machines with maximum feed rates of 150' per minute can be converted to deliver higher feed speeds in order to take advantage of higher production capability.
